

# Instant Eligibility Verification System & API Gateway

Public Consulting Group's (PCG) fully configurable, cloud-based Instant Eligibility Verification System & API Gateway (IEVS) is an off-the-shelf system which centralizes agency access to the best data competing commercial vendors offer—as well as any configured state and/or federal data sources—via a single interface with PCG. IEVS instantly uses every employed data source to:

- ✓ **Predict client eligibility for every configured public assistance program** based on the state-specific eligibility policy associated with each program
- ✓ Provide the reason(s) why each client is likely eligible or ineligible for each program
- ✓ Display the raw data supporting each eligibility recommendation
- ✓ **Consolidate all of the data and flags into a single, neatly organized output** supporting eligibility determination accuracy and one touch determination rates
- ✓ **"Learn" throughout any engagement** by reconciling actual agency eligibility decisions against IEVS recommendations on a monthly basis

By connecting to a stand-alone data hub like IEVS, Health and Human Services (HHS) agencies can:

- ✓ **Access dozens of sources via a single interface** while avoiding the need to contract for, implement, and maintain dozens of separate interfaces
- ✓ **Adopt new data sources and discontinue the use of ineffective data sources in days**, rather than months
- ✓ **Enhance or replace your ex parte** and automated renewal processes
- ✓ Improve **one touch** eligibility determination rates

- ✓ Reduce eligibility determination errors and **improve the accuracy of determinations**
- ✓ **Repoint PCG's interface to other agency and state systems** requiring the use of data without reprocurring data a second time

To connect to a stand-alone data hub like IEVS, Health and Human Services (HHS) agencies simply need to:

- ✓ **Define which data sources you want to query and when** based on each program, eligibility determination scenario, and/or end use application
- ✓ **Outline which automated, policy-based analytics and configurable business rules** each set of results data should be evaluated against
- ✓ **Define which HHS and/or state system(s) should be connected to the stand-alone data hub** and which end use application will leverage the data hub
- ✓ **Identify their preferred connection method**, including API, batch, on-screen HTML reporting, or via PCG's stand-alone application
- ✓ **Define your preferred output content and format** where PCG neatly organizes all of the results data and analytics into a single, organized output which can be efficiently used to facilitate automated or one touch eligibility determinations
- ✓ **Leverage PCG's expertise gained from assisting 36 states, and the District of Columbia, in connecting to third-party data used to inform HHS eligibility and enrollment activities**
